Section 1 : Coding

1. Problem Statement

Hemanth is designing a banking system for XYZ Bank. The system should allow customers to perform deposit, withdrawal, and balance inquiry operations. Implement exception handling for scenarios involving invalid transaction amounts or insufficient funds.

Create two custom exception classes, InvalidAmountException and InsufficientFundsException, both extending the Exception class.Throw an InvalidAmountException with a message if the deposit amount is less than or equal to zero.Throw an InsufficientFundsException if the withdrawal amount is greater than the available balance.Deduct the withdrawal amount from the balance if the withdrawal is successful.

Assist Hemanth in designing the program.

Input Format

The first line of input consists of a double value B, representing the initial balance.

The second line consists of a double value D, representing the deposit amount.

The third line consists of a double value W, representing the withdrawal amount.

Output Format

If the withdrawal is successful, print the amount withdrawn and the current balance, rounded off to one decimal place.

If an InvalidAmountException occurs, print "Error: [D] is not valid".

If an InsufficientFundsException occurs, print "Error: Insufficient funds".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1050.1
270.2
150.3
Output: Amount Withdrawn: 150.3
Current Balance: 1170.0

Answer

```
// You are using Java
import java.util.*;

class InsufficientFundsException extends Exception{
   public InsufficientFundsException() {
      super("Insufficient funds");
   }
}

class InvalidAmountException extends Exception{
   public InvalidAmountException(double d) {
      super(d + " is not valid");
```

```
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);

        double bal = s.nextDouble();
        double dep = s.nextDouble();
        double wit = s.nextDouble();

        try {

            if (dep <= 0) {
                throw new InvalidAmountException(dep);
            }
            bal += dep;
            if (wit <= 0) {
                throw new InvalidAmountException(wit);
            }
            if (bal < wit) {
                throw new InsufficientFundsException();
            }
            bal-=wit;
            System.out.printf("Amount Withdrawn: %.1f\nCurrent Balance: %.1f", wit,
bal);

        }catch (Exception e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

Status : Correct **Marks : 10/10**

2. Problem Statement

Tim was tasked with creating a user profile system that validates the user's date of birth input. The system should throw a custom exception,

InvalidDateOfBirthException, if the date is not in the specified format "dd-mm-yyyy" or if it represents an invalid calendar date.

The main method takes user input, validates the date of birth, and prints whether it is valid or not.

Input Format

The input consists of a string, representing the date of birth of the user.

Output Format

The output displays one of the following results:

If the entered date of birth is valid according to the specified format, the program prints:

"[Date] is a valid date of birth"

If the entered date of birth is not valid according to the specified format, the program prints:

"Invalid date: [Date]"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 01-01-2000

Output: 01-01-2000 is a valid date of birth

Answer

```
// You are using Java
import java.util.*;
import java.text.*;

class InvalidDateOfBirthException extends Exception {
    public InvalidDateOfBirthException(String date) {
        super("Invalid date: " + date);
    }
}
```

```
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);

        String x = s.nextLine().trim();

        SimpleDateFormat sdf = new SimpleDateFormat("dd-MM-yyyy");
        sdf.setLenient(false);
        try {
            sdf.parse(x);
            if (false) {
                throw new InvalidDateOfBirthException(x);
            }
            System.out.println(x + " is a valid date of birth");
        }catch (Exception e) {
            System.out.println("Invalid date: " + x);
        }
    }
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Faustus is managing his bank account and wants to create a program to update his account balance based on certain conditions. However, he needs to handle specific scenarios related to invalid inputs and insufficient balances. Faustus wants to update his account balance. He inputs the current balance and the amount to be updated.

The initial account balance should be positive. If Faustus enters a negative initial balance, the program should throw an InvalidAmountException with the message "Invalid amount. Please enter a positive initial balance."If the amount to be updated is negative, the program should check if the subtraction results in a negative balance. If so, it should throw an InsufficientBalanceException with the message "Insufficient balance."If the amount to be updated is positive, it should be added to the current balance, and the new balance should be printed.

Implement a custom exception, InvalidAmountException, and InsufficientBalanceException, to manage his bank account.

Input Format

The first line of input consists of a double value 'd', representing the initial account balance.

The second line of input consists of a double value 'd1', representing the amount to be updated.

Output Format

The output is displayed in the following format:

If the validation passes, print

"Account balance updated successfully! New balance: {new_balance}"

where {new_balance} is the updated account balance.

If the initial bank amount is negative it displays

"Error: Invalid amount. Please enter a positive initial balance."

If the updated amount exceeds the initial account balance in withdrawal it displays

"Error: Insufficient balance."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1000
500
Output: Account balance updated successfully! New balance: 1500.0

Answer

```
// You are using Java
import java.util.*;
```

```
class InvalidAmountException extends Exception {
    public InvalidAmountException() {
        super("Invalid amount. Please enter a positive initial balance.");
    }
}
class InsufficientBalanceException extends Exception {
    public InsufficientBalanceException() {
        super("Insufficient balance.");
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        double bal = s.nextDouble();
        double wit = s.nextDouble();

        try {
            if (bal < 0) {
                throw new InvalidAmountException();
            }

            bal += wit;
            if (bal < 0) {
                throw new InsufficientBalanceException();
            }
            System.out.println("Account balance updated successfully! New balance:
" + bal);
        }catch (Exception e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Camila, a user of a social media platform, is looking to change her password to enhance account security. The platform enforces specific

rules for password strength to ensure the safety of user accounts. Camila needs a program that prompts her to enter a new password and throws custom exceptions based on the strength of the password.

Password Strength Criteria:

Weak Password:

Length less than 8 characters.Medium Password:

Length 8 or more characters.Missing a mix of uppercase letters, lowercase letters, and digits.

Implement a custom exception, to assist Camila in changing her password securely. The program should interactively take user input for a new password, categorize its strength, and handle custom exceptions (WeakPasswordException and MediumPasswordException) if the password fails to meet the specified criteria.

Input Format

The input consists of a string s, representing the new password.

Output Format

The output is displayed in the following format:

If the entered password meets the strength criteria, the program outputs

"Password changed successfully!"

If the entered password is weak, the program outputs

"Error: Weak password. It must be at least 8 characters long."

If the entered password is of medium strength, the program outputs

"Error: Medium password. It must include a mix of uppercase letters, lowercase letters, and digits."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: ComplexP@ss1

Output: Password changed successfully!

Answer

```
// You are using Java
import java.util.*;

class WeakPasswordException extends Exception {
    public WeakPasswordException() {
        super("Weak password. It must be at least 8 characters long.");
    }
}

class MediumPasswordException extends Exception {
    public MediumPasswordException() {
        super("Medium password. It must include a mix of uppercase letters,
lowercase letters, and digits.");
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String p = s.nextLine();

        int u = 0, l = 0, d = 0, sc = 0;

        for (int i = 0;i < p.length(); i++) {
            int c = p.charAt(i);

            if ('A' <= c && 'Z' >= c) {
                u++;
            }else if ('a' <= c && 'z' >= c) {
                l++;
            }else if ('0' <= c && '9' >= c) {
                d++;
            }else {
                sc++;
            }
        }
```

```
        try {
            if (p.length() < 8) {
                throw new WeakPasswordException();
            }

            if (u == 0 || l == 0 || d == 0) {
                throw new MediumPasswordException();
            }
            System.out.println("Password changed successfully!");
        }catch (Exception e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}
```
